Master 2: International Centre for Fundamental Physics

INTERNSHIP PROPOSAL

Laboratory name: Physique et Mécanique des Milieux Hétérogènes, UMR 7636
Internship director' surname: Marcq
E-MAIL: philippe.marcq@espci.fr Phone number: 01 40 79 47 10
Web page: https://blog.espci.fr/pmarcq/
Internship location: laboratoire PMMH, Jussieu, Paris

Thesis possibility after internship: YES Funding: not yet

Pattern formation during Hydra regeneration

Keywords: pattern formation, theoretical biophysics, mechanobiology

Chemical instabilities such as the Turing instability [1] have had a profound impact on our understanding and definition of self-organization. They are fascinating examples of how non-linear interactions of several components can lead to order at a higher level. Chemical instabilities have naturally been proposed to explain the morphogenesis of living organisms through a chemical patterning driven by the diffusion and reaction of morphogens [2].

Hydra vulgaris is a freshwater polyp famous for its regenerative capacities, as virtually any tissue piece amputated from an adult Hydra or even re-aggregated cells can regenerate into a viable organism and do so through a *de novo* axis definition.

Remarkably, spherically-shaped regenerating *Hydra* pieces undergo several osmotically-driven oscillations [3] before a Turing-like instability determines the position of the future head of the organism as the local maximum of a morphogen's concentration.

Based on known observational and biochemical data [3,4], the intern will formulate and analyse a reaction-diffusion model on an oscillating sphere, able to recapitulate the first symmetry-breaking of *Hydra* during the process of its regeneration.
